

Thayer Sewer System

This is SIRWA's first "Low Pressure Sewer System." A low pressure system requires a grinder pump installed at every house, which is then connected to forced main lines. These mains, measuring one and a half to three inches in diameter, flow to a two cell, controlled discharged, lagoon.

The two cell lagoon is completed and ready to receive waste water and all the pits are installed. This spring, R D Utilities will be connecting each house to their grinder pit. All pits should be fully operational by the end of June. Clean up and seeding will then commence this fall. When the project is completed there should be approximately 34 customers serviced by the system.
